

It's possible to catch the new coronavirus, and not know it. That's because not everyone infected with the virus has symptoms. But there's a fast blood test that may tell you if you've ever been infected. It's called an antibody test.

What Is an Antibody Test?

You may hear it called a serology test. It looks for certain things called antibodies in your blood. Your body makes these when it fights an infection, like COVID-19. The same thing happens when you get a vaccine, like a flu shot. That's how you develop immunity to a virus. The antibody test isn't checking for the virus itself. Instead, it looks to see whether your immune system -- your body's defense against illness -- has responded to the infection.

How Does It Work?

You give some blood through a finger prick. The test is for two kinds of antibodies to the new coronavirus...IgM antibodies, which develop early in an infection, and IgG antibodies, which are likely show up after you've recovered. The total test takes about ten minutes.

How Accurate is the Test?

Stanford University's Center for Health Policy reports the sensitivity between 80 and 90% and specificity to be 99.5%.

**Questions?
Quick answers:**

Email: qna@rightsign.org

COVID-19 IgG/IgM Rapid Antibody Test Cassette is now available!

Case of 20 individual tests *now only \$200.00*

That's \$10 per test.

Ships direct from factory to you using payment systems that guarantee delivery.

Minimum Order: 400 cases based on minimum cargo regulation of one cubic meter

Delivery: Contingent on Air shipment availability*
Typically one week.
*(*cutback on flights has severely impacted)*

Contents: Each case contains all elements to perform 20 complete tests.

How To Order:

Contact us for step by step paperwork process to guarantee the accuracy and safety of your shipment.

Working together, we WILL beat this virus.
